

# Hospitals Should Have Clean Drinking Water

Hospital's Drinking Water Challenges

Did you know ...

**Waterborne illnesses are more common than you may think**—especially in a hospital environment where diseases are more likely to be close by

**Large hospitals would face the greatest challenge due to their sheer size, but smaller institutions are not immune to the problem either**

**Most hospital administrators have a minimum of an MHA Degree (Masters of Health Administration)**

## The risks of unclean drinking water

**UNLESS YOUR HOSPITAL HAS SOME SORT OF FILTRATION SYSTEM** or is providing water from a source other than city tap water, you have a 25% chance that the water you are drinking is polluted with one or more contaminants.

**HOWEVER, IT'S NOT JUST DRINKING WATER HOSPITALS NEED TO CONSIDER** – water is used for so much more! Water is used for clinical procedures, the sterilisation of instruments, hand washing and more – all of which could spread a disease if afflicted.

**WHEN A PATIENT IS ALREADY UNWELL**, worrying about these additional risks is the last thing they should be facing.

Did you know ... **Elkay has products that provide fresh drinking water** and they can be installed in any hospital, care home or medical facility.
